ProjectName	**Streamlining IT Procurement: Automating Standard Laptop Orders with Flow Designer**
Maximum Marks	3 Marks

ARCHITECTURE DIAGRAM

Architecture Overview

The architecture represents the ServiceNow workflow described in the project for automating standard laptop procurement. A requester selects the Standard Laptop item through the Service Catalog. The request proceeds through approval, and the approved condition activates the configured Flow Designer process. The flow then creates a Catalog Task from the Requested Item and assigns the task to the Hardware group for configuration.

Architecture Components

The main components are the requester, ServiceNow Service Catalog, approval process, Flow Designer, Requested Item record, Catalog Task, and Hardware assignment group. The Flow Designer flow is named "Standard laptop task" and uses a Service Catalog trigger. Its Create Catalog Task action supplies the task information and assignment required for the laptop configuration.

ARCHITECTURE DESCRIPTION AND DATA FLOW

1. Request Layer

The requester initiates the process by selecting the Standard Laptop item from the Service Catalog and placing the order. The Standard Laptop item is part of the Hardware category in the project workflow.

2. Approval Layer

The submitted request proceeds to the approval stage. The project specifies that the Catalog Task is created with the Approval value set to “Approved.” The approval stage therefore provides the condition required before the automated configuration task is generated.

3. Automation Layer

The automation layer is implemented using ServiceNow Flow Designer. The project creates a flow named “Standard laptop task,” configured under the Global application and run as System User. The flow uses the Service Catalog trigger and a Create Catalog Task action.

4. Task Generation Layer

The Create Catalog Task action uses the Requested Item record. The generated task contains the short description “Laptop need to Configured” and is assigned to the Hardware group. This creates the operational task required for laptop configuration.

5. End-to-End Architecture Flow

Requester → Standard Laptop Service Catalog → Request Approval → Service Catalog Trigger → Flow Designer → Create Catalog Task → Hardware Assignment → Laptop Configuration. The architecture therefore connects the user's request to the final configuration task through an automated workflow.

Architecture Objective

The architecture is designed to reduce manual intervention, avoid delays in generating the configuration task, improve resource allocation, and provide a streamlined standard laptop procurement process. These objectives correspond to the project goals stated in the source document.
