ProjectName	**Streamlining IT Procurement: Automating Standard Laptop Orders with Flow Designer**
Maximum Marks	3 Marks

ER DIAGRAM

ER Overview

The ER model is a logical design representation for the records involved in the documented Service Catalog workflow. The project explicitly refers to the Service Catalog item, request, Requested Item, Catalog Task, approval, and Flow

Designer configuration.

Core Entities

- Service Catalog Item – represents the Standard Laptop catalog item.

- Request – represents the submitted procurement request and approval state.
- Requested Item – represents the requested catalog item record used by the flow.
- Catalog Task – represents the configuration task generated by the flow.
- Flow Execution – represents the automation trigger and action.

ENTITY RELATIONSHIPS AND DESCRIPTION

Service Catalog Item → Request

A Standard Laptop catalog item is selected by the requester and becomes the basis of the procurement request.

Request → Requested Item

The request is associated with its Requested Item record, which is supplied to the Create Catalog Task action.

Requested Item → Catalog Task

The Flow Designer action creates the Catalog Task from the Requested Item and populates the task's required values.

Flow Execution → Catalog Task

The Service Catalog trigger starts the flow, and the Create Catalog Task action produces the operational task.

Important Note

The uploaded project document describes the workflow and screenshots but does not provide a formal database ER schema. Therefore, this diagram is a logical project-design representation based only on the records and relationships explicitly used in the workflow.
